DATE MAILED: 11/16/2005				

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	09/810,511	CHILES ET AL.	
	Examiner	Art Unit	
	J. Bret Dennison	2143	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
 - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
 - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 8/30/05.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-45 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-45 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This Action is in response to Amendment for Application Number 09/810,511 received on 28 October 2004.
2. Claims 1-45 are presented for examination.

Double Patenting (Obviousness)

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

3. Claims 1-9 and 12-14 provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-9 and 10-12 of copending Application No. 09/810,421.
4. The subject matter claimed in the instant application is not patentably distinct from Application No. 09/810,421, as follows:

Application No. 09/810,421	<i>Instant Application: 09/810511</i>
1. A system for connecting multiple home-networked client devices to a host system,	<i>1. A system for connecting multiple home-networked client devices to a host system,</i>

wherein the host system assigns independent Internet addresses to the home networked client devices, the system comprising:	<i>wherein the host system assigns independent Internet addresses to the home networked client devices, the system comprising:</i>
a home gateway device which includes a communication device to communicate with the host system over a single communication tunnel established between the home gateway device and the host system; and	<i>a home gateway device which includes a communication device to communicate with the host system over a single communication tunnel established between the home gateway device and the host system, wherein the home gateway device includes a network address translation module; and</i>
multiple home-networked client devices connected to the home gateway device via a network and that communicate with the host system through the home gateway device over the single communication tunnel,	<i>multiple home-networked client devices connected to the home gateway device via a network and that communicate with the host system through the home gateway device over the single communication tunnel,</i>
wherein the host system is configured to establish individual communication sessions with the multiple home-networked client devices over the single	<i>wherein the host system is configured to establish individual communication sessions with the multiple home-networked client devices over the single</i>

communication tunnel and to assign independent Internet addresses to each of the multiple home networked client devices.	<i>communication tunnel and to assign independent Internet addresses to each of the multiple home networked client devices.</i>
2. The system of claim 1 wherein the home gateway device is physically located in a personal residence.	<i>2. The system of claim 1 wherein the home gateway device is physically located in a personal residence.</i>
3. The system of claim 2 wherein the personal residence is a single family dwelling.	<i>3. The system of claim 2 wherein the personal residence is a single family dwelling.</i>
4. The system of claim 1 wherein the home gateway device and the home networked client devices are physically located in a personal residence.	<i>4. The system of claim 1 wherein the home gateway device and the home networked client devices are physically located in a personal residence.</i>
5. The system of claim 4 wherein the personal residence is a single family dwelling.	<i>5. The system of claim 4 wherein the personal residence is a single family dwelling.</i>
6. The system of claim 2 wherein the home-networked client devices include wireless client devices that are connected to the home gateway device via a wireless network.	<i>6. The system of claim 2 wherein the home-networked client devices include wireless client devices that are connected to the home gateway device via a wireless network.</i>

7. The system of claim 6 wherein the wireless client devices operate outside of the personal residence.	<i>7. The system of claim 6 wherein the wireless client devices operate outside of the personal residence.</i>
8. The system of claim 1 wherein the home-networked client devices establish simultaneous individual communication sessions with the host system over the single communication tunnel and each home-networked client device is assigned an independent Internet address by the host system.	<i>8. The system of claim 1 wherein the home-networked client devices establish simultaneous individual communication sessions with the host system over the single communication tunnel and each home-networked client device is assigned an independent Internet address by the host system.</i>
9. The system of claim 1 wherein the host system includes an Internet Service Provider.	<i>9. The system of claim 1 wherein the host system includes an Internet Service Provider.</i>
10. The system of claim 1 wherein the home gateway device communicates with the multiple home-networked client devices using a first protocol and communicates with the host system using a second protocol.	12. The system of claim 1 wherein the home gateway device communicates with the multiple home-networked client devices using a first protocol and communicates with the host system using a second protocol.
11. The system of claim 10 wherein the first protocol and the second protocol are	13. The system of claim 10 wherein the first protocol and the second protocol are

the same.	the same.
12. The system of claim 10 wherein the second protocol differs from the first protocol.	14. The system of claim 10 wherein the second protocol differs from the first protocol.

5. Although the conflicting claims are not identical, they are not patentably distinct from each other because the limitations of both applications are significantly the same. It would have been obvious to one in the ordinary skill in the art at the time the invention was made to have included a network address translation module into Application No. 09/810,421 because it is extremely well known in the art for network gateways to include network address translating modules.

6. This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

7. Claims 21-33 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 43-53, 55, and 56 of copending Application No. 09/810,421.

8. The subject matter claimed in the instant application is not patentably distinct from Application No. 09/810/421, as follows:

Application No. 09/810,421	<i>Instant Application: 09/810511</i>
43. A method for connecting multiple home-networked client devices to a host	<i>21. A method for connecting multiple home-networked client devices to a host</i>

system, wherein the host system assigns independent Internet addresses to the home networked client devices, the method comprising:	<i>system, wherein the host system assigns independent Internet addresses to the home networked client devices, the method comprising:</i>
using the home gateway device to receive a request from at least one home networked client device to communicate with the host system,	<i>using the home gateway device to receive a request from at least one home networked client device to communicate with the host system,</i>
wherein the home-networked client device is connected to the home gateway device via a network;	<i>wherein the home-networked client device is connected to the home gateway device via a network;</i>
using the home gateway device to establish communications with the host system over a single communication tunnel;	<i>using the home gateway device to establish communications with the host system over a single communication tunnel;</i>
using the home gateway device to establish with the host system an individual communication session over the single communication tunnel, wherein the individual communication session is based on an independent Internet address assigned by the host system to the home	<i>using the home gateway device to establish with the host system an individual communication session over the single communication tunnel, wherein the individual communication session is based on an independent Internet address assigned by the host system to the home</i>

networked client device that requested to communicate with the host system; and	<i>networked client device that requested to communicate with the host system; and</i>
using the home gateway device to process communications between the home networked client device and the host system.	<i>using the home gateway device to process communications between the home networked client device and the host system by mapping the independent Internet address assigned by the host system for the home-networked client device to a local address used between the home gateway device and the home-networked device.</i>
44. The method of claim 43 further comprising physically locating the home gateway device in a personal residence such that the request is received in the personal residence.	<i>22. The method of claim 21 further comprising physically locating the home gateway device in a personal residence such that the request is received in the personal residence.</i>
45. The method of claim 44 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.	<i>23. The method of claim 22 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.</i>
46. The method of claim 43 further comprising physically locating the home	<i>24. The method of claim 21 further comprising physically locating the home</i>

gateway device and the home-networked client devices in a personal residence such that the request is received in the personal residence.	<i>gateway device and the home-networked client devices in a personal residence such that the request is received in the personal residence.</i>
47. The method of claim 46 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.	<i>25. The method of claim 24 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.</i>
48. The method of claim 43 further comprising:	<i>26. The method of claim 21 further comprising:</i>
using the home gateway device to establish with the host system multiple simultaneous individual communication sessions over the single communication tunnel, wherein the multiple simultaneous individual communication sessions are each based on an independent Internet address assigned to the home-networked client devices that request to communicate with the host system; and	<i>using the home gateway device to establish with the host system multiple simultaneous individual communication sessions over the single communication tunnel, wherein the multiple simultaneous individual communication sessions are each based on an independent Internet address assigned to the home-networked client devices that request to communicate with the host system; and</i>
using the home gateway device to process	<i>using the home gateway device to process</i>

communications between the home networked client devices and the host system.	<i>communications between the home networked client devices and the host system.</i>
49. The method of claim 43 wherein the host system includes an Internet Service Provider.	<i>27. The method of claim 21 wherein the host system includes an Internet Service Provider.</i>
50. The method of claim 43 wherein using the home gateway device to process communications between the home-networked client device and the host system includes:	<i>28. The method of claim 21 wherein using the home gateway device to process communications between the home-networked client device and the host system includes:</i>
using the home gateway device to communicate with the home-networked client device using a first protocol; and	<i>using the home gateway device to communicate with the home-networked client device using a first protocol; and</i>
using the home gateway device to communicate with the host system using a second protocol.	<i>using the home gateway device to communicate with the host system using a second protocol.</i>
51. The method of claim 50 wherein the first protocol and the second protocol are the same.	<i>29. The method of claim 28 wherein the first protocol and the second protocol are the same.</i>
52. The method of claim 50 wherein the	<i>30. The method of claim 28 wherein the</i>

Art Unit: 2143

second protocol differs from the first protocol.	<i>second protocol differs from the first protocol.</i>
--	---

9. Although the conflicting claims are not identical, they are not patentably distinct from each other because the limitations of both applications are significantly the same. It would have been obvious to one in the ordinary skill in the art at the time the invention was made to have incorporated into Application No. 09/810,421, using the gateway device to process communications between the home-networked client device and the host system by mapping the independent Internet address assigned by the host system for the home-networked client device to a local address used between the home gateway device and the home-networked device because this is the function of a network address translator, and as mentioned above, it is extremely well known in the art for network gateways to include network address translating modules.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

10. Claims 34-45 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 61-72 of copending Application No. 09/810,421.

11. The subject matter claimed in the instant application is not patentably distinct from Application No. 09/810/421, as follows:

Application No. 09/810,421	<i>Instant Application: 09/810511</i>
-----------------------------------	--

61. A method for connecting multiple home-networked client devices to a host system, wherein the host system assigns independent Internet addresses to the home networked client devices, the method comprising:	34. A method for connecting multiple home-networked client devices to a host system, wherein the host system assigns independent Internet addresses to the home networked client devices, the method comprising:
using the host system to receive a request for an individual communication session with a home-networked client device;	using the host system to receive a request for an individual communication session with a home-networked client device;
using the host system to establish communications with the home gateway device over a single communication tunnel;	using the host system to establish communications with the home gateway device over a single communication tunnel;
using the host system to establish with the home gateway device the individual communication session over the single communication tunnel, wherein establishing the individual communication session includes using the host system to assign an independent Internet address to the home-networked client device that requested to communicate with the host	using the host system to establish with the home gateway device the individual communication session over the single communication tunnel, wherein establishing the individual communication session includes using the host system to assign an independent Internet address to the home-networked client device that requested to communicate with the host

system; and	system; and
communicating between the host system and the home-networked client device through the home gateway device over the individual communication session.	communicating between the host system and the home-networked client device through the home gateway device over the individual communication session, wherein the independent Internet address is mapped to a local address.
62. The method of claim 61 further comprising physically locating the home gateway device in a personal residence such that the request is received in the personal residence.	35. The method of claim 34 further comprising physically locating the home gateway device in a personal residence such that the request is received in the personal residence.
63. The method of claim 62 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.	36. The method of claim 35 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.
64. The method of claim 61 further comprising physically locating the home gateway device and the home-networked client devices in a personal residence such that the request is received in the personal residence.	37. The method of claim 34 further comprising physically locating the home gateway device and the home-networked client devices in a personal residence such that the request is received in the personal residence.

65. The method of claim 64 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.	38. The method of claim 37 wherein the personal residence is a single family dwelling such that the request is received in the single family dwelling.
66. The method of claim 61 further comprising:	39. The method of claim 34 further comprising:
using the host system to establish multiple simultaneous individual communication sessions with the home gateway device over the single communication tunnel, wherein establishing the multiple simultaneous individual communication sessions includes assigning an independent Internet address to each home-networked client device that requests to communicate with the host system; and	using the host system to establish multiple simultaneous individual communication sessions with the home gateway device over the single communication tunnel, wherein establishing the multiple simultaneous individual communication sessions includes assigning an independent Internet address to each home-networked client device that requests to communicate with the host system; and
communicating between the host system and the home-networked client devices through the home gateway device over the multiple simultaneous individual communication	communicating between the host system and the home-networked client devices through the home gateway device over the multiple simultaneous individual communication

sessions.	sessions, wherein each independent Internet address is mapped to a local address assigned to each home-networked client device.
67. The method of claim 66 further comprising having the host system use the assigned independent Internet address to communicate individual information maintained by the host system to the home-networked client devices.	40. The method of claim 39 further comprising having the host system use the assigned independent Internet address to communicate individual information maintained by the host system to the home-networked client devices.
68. The method of claim 67 wherein the individual information includes host based parental controls.	41. The method of claim 40 wherein the individual information includes host based parental controls.
69. The method of claim 67 wherein the individual information includes wallet information.	42. The method of claim 40 wherein the individual information includes wallet information.
70. The method of claim 67 wherein the individual information includes calendar information.	43. The method of claim 40 wherein the individual information includes calendar information.
71. The method of claim 67 wherein the individual information includes personalized web page information.	44. The method of claim 40 wherein the individual information includes personalized web page information.

72. The method of claim 61 wherein the host system includes an Internet Service Provider.	45. The method of claim 34 wherein the host system includes an Internet Service Provider.
---	---

12. Although the conflicting claims are not identical, they are not patentably distinct from each other because the limitations of both applications are significantly the same. It would have been obvious to one in the ordinary skill in the art at the time the invention was made to have incorporated mapping independent addresses to local address into Application No. 09/810,421 because this is the function of a network address translator, and as mentioned above, it is extremely well known in the art for network gateways to include network address translating modules.

13. This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 21, and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Daruwalla et al. (U.S. Patent Number 6,693,878).

1. Regarding claim 1, 21, and 34, Daruwalla disclosed a system for connecting multiple networked client devices to a host system, wherein the host system assigns independent Internet addresses to the home-networked client devices (Daruwalla, col. 6, lines 55-67, col. 11, lines 40-50, col. 13, lines 10-20), the system comprising:

a home gateway device which includes a communication device to communicate with the host system over a single communication tunnel established between the home gateway device and the host system, wherein the home gateway device includes a network address translation module (Daruwalla, col. 6, lines 40-47); and

multiple home-networked client devices connected to the home gateway device via a network and that communicate with the host system through the home gateway device over the single communication tunnel (Daruwalla, col. 6, lines 55-67, col. 11, lines 40-50, Daruwalla disclosed devices behind a cable modem communicating with provisioning server or CMTS),

wherein the host system is configured to assign independent Internet addresses to the multiple home-networked client devices (Daruwalla, col. 7, lines 15-30, col. 13, lines 10-20, Daruwalla disclosed assigning addresses to multiple devices behind a cable modem; col. 7, line 35 through col. 8, line 10, 45-55, Daruwalla also disclosed the cable modem establishing a secure IPsec tunnel with VPN networks, and intelligence is maintained in the network rather than in the end points).

Daruwalla did not explicitly state wherein the cable modems include a tunnel to the Head End/provisioning server (Fig. 3, 322). However, since the cable modems initiate an IPsec tunnel over the MPLS VPN to the CE device (Fig. 3, 352), the tunnel

Art Unit: 2143

would have to exist between the cable modem (Fig. 3, 304) and the Head End (320) of Figure 3. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a tunnel from a cable modem under VPN to the head end to establish a secure communication path between the cable modem and an authorized VPN gateway (Daruwalla, col. 7, lines 35-45).

Claims 21 and 34 include limitations that are substantially similar to claim 1 and are therefore rejected under the same art as being substantially similar.

Claims 1, 21, and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Network Telesystems, NTS Tunnel Builder User's Guide; March 1999, hereinafter referred to by NTS and in view of Newswire Association Inc, "Ramp Networks Announces Comprehensive Virtual Private Network Solution; Targets Corporate Branch Offices (August 9, 1999) hereinafter referred to by Ramp.

2. Regarding claim 1, 21, and 34, NTS disclosed a system for connecting multiple networked client devices to a host system, wherein the host system assigns independent Internet addresses to the home-networked client devices, the system comprising:

a home gateway device which includes a communication device to communicate with the host system over a single communication tunnel established between the home gateway device and the host system, wherein the home gateway device includes a network address translation module (NTS, Chapter 1-3, Figure at the top of the page,

Art Unit: 2143

NTS disclosed a tunnel established between a remote user and a PPTP/L2TP server through a cable modem or DSL, Chapter 1, TunnelBuilder Overview, thereby allowing devices from one LAN communicate through a tunnel, with devices on another LAN); and

a home-networked client device connected to the home gateway device via a network and that communicate with the host system through the home gateway device over the single communication tunnel (NTS, Chapter 1-3, Figure at the top of the page, Chapter 3-14, Addresses),

wherein the host system is configured to establish an individual communication session with the networked client device over the single communication tunnel and to assign an independent Internet address to the networked client device (NTS, Chapter 3-3, NTS disclosed that once the tunnel is established, an assignment of a new and different IP address, gateway and DNS server addresses is performed).

NTS did not explicitly state wherein the host system is configured to establish individual communication sessions with multiple networked devices over the single communication tunnel.

In an analogous art, Ramp disclosed a VPN supported hub that allows multiple users sessions on a single tunnel (Ramp, page 1, paragraph 2).

Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to substitute the remote computer of NTS with a router, allowing multiple clients to use the same tunnel for VPN into the DHCP server of NTS, for the benefit of sharing the same secure communication path from the home cable modem or

DSL of NTS (NTS, Chapter 2) to the DHCP server and simplifying end user configuration and reducing the number of VPN sessions required (Ramp, page 1, paragraph 2).

Claims 21 and 34 include limitations that are substantially similar to claim 1 and are therefore rejected under the same art as being substantially similar.

Claims 1-45 are rejected under 35 U.S.C. 103(a) as being unpatentable over Reed (U.S. Patent Number 6,671,739) in view of Kikinis (U.S. Patent Number 6,167,120) and in further view of Daruwalla et al. (U.S. Patent Number 6,693,878).

3. Regarding claim 1, 21, and 34, Reed discloses a system for connecting multiple networked client devices to a host system, wherein the host system assigns independent Internet addresses to the home-networked client devices, the system comprising:

a home gateway device which includes a communication device to communicate with the host system over a single communication tunnel established between the home gateway device and the host system, wherein the home gateway device includes a network address translation module (Reed, col. 4, lines 60-65); and

multiple networked client devices connected to the home gateway device via a network and that communicate with the host system through the gateway device over the single communication tunnel (Reed, col. 3, lines 15-20 and lines 45-63, and Fig 1B),

wherein the system is configured to enable the host system to establish individual communication sessions with the multiple networked client devices over the

Art Unit: 2143

single communication tunnel and to assign independent Internet addresses to the multiple networked client devices (Reed, col. 3, lines 15-20, 45-63).

Reed also discloses wherein the system is part of the local area network (Reed, col. 3, lines 10-20, lines 55-65). However, Reed does not explicitly state wherein the system contains multiple home network devices.

In an analogous art, Kikinis discloses a system for home networking wherein the home server provides internet access for a multiplicity of computers connected to the home server (Kikinis, col. 2, lines 30-35).

Therefore it would have been obvious to one having ordinary skill in the art at the time of the invention to incorporate the home networking system of Kikinis into the system of Reed in order to provide a way of allowing home computers in a network to share resources through one Internet Service Provider and one Internet account (Kikinis, col. 1, lines 40-55), wherein each client has a unique Internet address and are using an individual communication session (Reed, col. 1, lines 40-55).

Neither Reed nor Kikinis explicitly state a host system that assigns independent internet addresses to the home-networked client devices.

In an analogous art, Daruwalla disclosed a provisioning server in VPN communication with cable modems, in which the provisioning server assigns internet addresses to the devices behind the cable modems (Daruwalla, col. 6, lines 55-65).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teachings of Daruwalla into Reed and

Art Unit: 2143

Kikinis to provide a tunnel from a cable modem under VPN to the head end to establish a secure communication path to the DHCP server (Daruwalla, col. 7, lines 35-45).

Claims 21 and 34 include limitations that are substantially similar to claim 1 and are therefore rejected under the same art as being substantially similar.

14. Regarding claim 2, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the home gateway device is physically located in a personal residence (Kikinis, col. 4, lines 7-13). See motivation for claim 1.

15. Regarding claim 3, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 2, including wherein the personal residence is a single family dwelling (Kikinis, col. 4, lines 7-13). See motivation for claim 1.

16. Regarding claim 4, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the home gateway device and the home-networked client devices are physically located in a personal residence (Kikinis, col. 4, lines 7-13). See motivation for claim 1.

17. Regarding claim 5, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 4, including wherein the personal

Art Unit: 2143

residence is a single family dwelling (Kikinis, col. 4, lines 7-13). See motivation for claim 1.

18. Regarding claims 6 and 7, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 2. Reed and Kikinis do not explicitly state wherein the home-networked client devices include wireless client devices that are connected to the home gateway device via a wireless network. However, it would have been obvious to one having ordinary skill in the art at the time of the invention to incorporate wireless devices into the system of Reed and Kikinis because wireless networking is a form of networking, which is well known in the art well before Reed and Kikinis.

19. Regarding claim 8, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the home-networked client devices establish simultaneous individual communication sessions with the host system over the single communication tunnel and each home-networked client device is assigned an independent Internet address by the host system (Reed, col. 3, lines 10-25).

20. Regarding claim 9, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the host system includes an Internet Service Provider (Kikinis, col. 1, lines 45-50).

21. Regarding claim 10, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the network address translation module includes a port-based network address translation module (Reed, col. 4, lines 60-67).

22. Regarding claim 11, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the network address translation module includes an address-based network address translation module (Reed, col. 4, lines 60-67).

23. Regarding claim 12, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the home gateway device communicates with the multiple home-networked client devices using a first protocol and communicates with the host system using a second protocol (Kikinis, Fig. 2).

24. Regarding claim 13, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 12, including wherein the first protocol and the second protocol are the same (Kikinis, col. 4, last paragraph, Kikinis discloses that both are TCP/IP).

25. Regarding claim 14, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 12, including wherein the second protocol differs from the first protocol (Kikinis, col. 5, lines 28-30).

26. Regarding claim 15, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 12, including wherein the first protocol is TCP/IP (Kikinis, col. 5, lines 20-30). Kikinis also discloses wherein the communication between PC and the Internet service provider are by different protocols. However, Kikinis does not explicitly state that the different protocols include L2TP. It would have been obvious to one having ordinary skill in the art at the time of the invention to incorporate the L2TP protocol between the gateway device and host system because L2TP is a standard that allows the transfer of Point to Point Protocol (PPP) traffic between different networks.

27. Regarding claim 16, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 15, including wherein the home gateway device includes a network address translation module (Reed, col. 4, lines 60-67). Reed and Kikinis do not explicitly state wherein the home gateway includes an L2TP access concentrator. It would have been obvious to one having ordinary skill in the art at the time of the invention to incorporate the L2TP protocol between the gateway device and host system because L2TP is a standard that allows the transfer of Point to Point Protocol (PPP) traffic between different networks.

28. Regarding claim 17, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 16, including wherein the network address translation module includes a port-based network address translation module(Reed, col. 4, lines 60-67).

29. Regarding claim 18, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 16, including wherein the network address translation module includes an address-based network address translation module (Reed, col. 4, lines 60-67).

30. Regarding claim 19, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 18, including wherein the network address translation module interfaces with the home-networked client devices and the host system to route communications between the host system to the home-networked client devices by translating the independent Internet addresses assigned by the host system to the home-networked client devices and local addresses belonging to the home-networked client devices that are used on the network between the home gateway device and the home-networked client devices (Reed, col. 4, lines 60-67).

31. Regarding claim 20, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 19, including wherein the multiple home-

Art Unit: 2143

networked client devices are recognized by the host system as independent client devices through the use of unique identifiers (Reed, col. 3, lines 15-20).

32. Claims 21-31 include a method with the same limitations of claims 1-15.

Therefore claims 21-31 are rejected with the same art used in the rejection of claims 1-15.

33. Regarding claim 32, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 21, including wherein using the home gateway device to process communications between the home-networked client device and the host system includes removing a first header including the local address from the communications received from the home-networked client device destined for the host system (Reed, Fig. 2), adding a second header including the independent Internet address to the communications (Reed, Fig. 2); and sending the communications with the second header to the host system (Reed, Fig. 2).

34. Regarding claim 33, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 32, including wherein using the home gateway device to process communications between the home-networked client device and the host system includes removing a third header including the independent internet address from the communications received from the host system destined for the home-networked client device, adding a fourth header including the local address,

Art Unit: 2143

and sending the communications with the fourth header to the home-networked client device (Reed, col. 4, lines 60-67, Reed discloses the use of Network Address Translation wherein packets are modified for communication between networks and addresses are modified as packets are passed through the network translator).

35. Claims 34-40 include a method with the same limitations of claims 1-26.

Therefore claims 34-40 are rejected with the same art used in the rejection of claims 1-26.

36. Regarding claims 41-44, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 40, including wherein the clients have access to information on the internet and other networks. Reed and Kikinis do not explicitly state wherein the information consists of host based parental controls, wallet information, calendar information, or personalized web page information. However, this type of information is basic information found on the Internet. Therefore, it would have been obvious to one having ordinary skill in the art at the time of the invention to incorporate information such as host based parental controls, wallet information, calendar information, or personalized web page information into Reed and Kikinis to provide basic Internet information to clients connected to the system.

Art Unit: 2143

37. Regarding claim 45, Reed, Kikinis and Daruwalla disclosed the limitations, substantially as claimed, as described in claim 34, including wherein the host system includes an Internet Service Provider (Kikinis, col. 1, lines 40-55).

Conclusion

Examiner's Note: Examiner has cited particular columns and line numbers in the references applied to the claims above for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner.

In the case of amending the claimed invention, Applicant is respectfully requested to indicate the portion(s) of the specification which dictate(s) the structure relied on for proper interpretation and also to verify and ascertain the metes and bounds of the claimed invention.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to J. Bret Dennison whose telephone number is (571) 272-3910. The examiner can normally be reached on M-F 8:30am-5pm.

Art Unit: 2143

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David A Wiley can be reached on (571) 272-3923. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
